Your 1-Page Plan

Vizdale Full-Stack Developer Internship

Your Name	Kishore Kumar
Project	ClientLocker
Client	Vaigai Vel & Associates, an accounting firm in Madurai
Who will use it?	Partners, staff, the firm's clients, and outside auditors
Your How Might We, in your own words	How might we give each person at an accounting firm only the client files they need, cut off access the moment it should end, and show partners who opened what?
Your tool in one sentence	ClientLocker is a private file locker where each person can open only the client files they are allowed to see, and every attempt is logged for the partners.

#	5 things a user can do
1	Log in and land on the screen for my role: partner, staff, client, or auditor
2	As staff, upload a PDF, JPG, or PNG for an assigned client, and open it through a 10-minute link
3	As a partner, give or remove someone's access to a client, with removal working on their next request
4	As a partner, read one log of every upload, open, blocked attempt, and access change
5	As a client, log in with an email link, and see and open only my own files

Your AI feature	After an upload, the AI reads the file's first page and suggests which open checklist item it fills. A person confirms it. If the AI fails or the file has no readable text, the person picks by hand.
Main screens	Login. Partner: all clients, one client (files, checklist, access), activity log. Staff: my clients, one client with upload. Client: my files. Auditor: my 2 clients, one client with no upload.
Made-up data you will use	1 firm, 2 partners, 6 staff including a trainee, 1 auditor, 10 clients with 5 checklist items each, and AI-written PDFs. No real people or businesses.
What worries you most?	One missed access check could expose another client's file, so I will test by pasting addresses directly.
